Preliminary Specifications

### Receive and Transmit Audio.

Wyse TCX Rich Sound virtualization software enables the deployment of virtual desktops and applications capable of receiving and transmitting audio without compromise.

### Broadens the Reach of VDI Deployments.

Wyse TCX Rich Sound 1.0 is the software that provides bi-directional audio capabilities for virtual desktops and applications on RDP connections in VDI environment. Users can now use a USB headset directly attached to the Wyse thin client to input and output audio to and from an IP soft phone application running in a Windows XP Pro virtual desktop. This revolutionary technology broadens the reach of VDI deployments by enabling support for users requiring special audio input-output capabilities.

## At a glance:

### User Experience

- Enables bi-directional audio over RDP - VDI users can now run applications that require audio input capabilities.
- IP based Cisco softphone applications in a virtual desktop can work in tandem with thin client attached USB Logitech headsets (composite headsets not supported for this initial release).
- Eliminates the need for a separate hardware IP phone unit.
- No compromised thin computing experience. Unique software enhancement for Wyse product family only.

### Connectivity

- Supports regular VDI deployments with RDP and XP Pro based virtual desktops.
- Coupled with Wyse TCX USB Virtualizer 2.0, audio-video chat applications like Skype can be supported in a VDI environment.
